What's New in the I2Phex?

General Overview I2Phex is a binary file based client for I2P. When running, I2Phex will set up a tunnel to I2P. From then on you can download files as though you were connected through a web browser. I2Phex is not a file sharing protocol, it's a file transfer protocol. For instance, with I2Phex you can download a file from an I2P server. The files can be any file type you can imagine. I2Phex also allows file uploads from a client to an I2P server. I2Phex also allows

you to connect to networks other than I2P. For instance, you could download a file from a Gnutella server. The I2Phex client/server protocol was originally created by George Hotz in 2006, and this client was used to distribute a few I2P files on I2P. The protocol was re-designed in 2009 by Paul Syverson, Andrew Seche, Adam Langley and Carsten Schulz. The I2Phex client and server are written in Java. The next release will have more features. The main idea of the client is that it uses a really

high level of obfuscation and looks like a web browser to fool the user. Getting started It's fairly straightforward to get going. You need Java 5 or later. First download I2Phex from Google Code or I2Phex from Google Chrome Web Store The build is a bit of a problem. I have a very slow connection to the internet and so only upload and download files in small chunks. It's best to use your wired connection to download the install file and then install it over a wifi or DSL link. I have almost no

experience with java. I'd be eternally grateful if you could point me to some tutorials. I'm aware of the very, very basic tutorials on the i2p wiki. They're very, very basic and if it were easier to get started with with some online tutorials I'd happily take a look at that. I was actually thinking of using Hamachi for this, and simply host files on it from my server to try this out. I'd have to use the client built into Hamachi for this, but I may be able to just tunnel through that and as long as it works I'd be happy. The

client will
