The specific behavior you are seeing when the PC goes into "sleep mode" occurs normally on any PC whether its running Windows 7, Windows 8, or Windows 8.1. Many users do not recognize it as such and as such they expect Windows to save their work or specific settings on a computer when it sleep mode. Instead, once the PC is in sleep mode, its settings are saved and if you were working on a computer when the PC locked up, you will see the changes you made in the last session. The reason this happens, is because the computer turns the hard drive off and then puts itself into a "sleep" mode. Since the hard drive is turned off, it no longer has access to any data, and therefore, will not save any. The reason your actions are being saved, is because programs and settings have a unique place where this data is stored. Note that this unique storage area is not currently saved in either Windows 8.1 or Windows 10. Why is this happening? Windows continues to work when the computer is asleep. Programs like Windows Mail, Internet Explorer, and others continue to work when in sleep mode and Windows continues to process. This is generally not a worry for most users, as they are conscious when they put their computer to sleep. This behavior is one of those things users do expect and is standard on any computer. To all the beginners out there and to those users of first time PC classes, make sure to have a few simple questions answered in the following blog post, that will surely be of help to you. Passive acoustic monitoring, with and without hydrocyclones, was used to assess the effects of ship draft on estuarine bed stability. The monitoring vessels were towed, at a mean speed of 0.5 knots, through a series of sediment samples in a recirculating test section of a natural harbour, and the bed shear stress was measured. The pressure pulses from the monitoring were converted into particle velocity using a pressure-driven contour map from a previous experiment in the same section. The potential effect of the ship's propeller on bed shear stress was found to be small. A second set of experiments with the monitoring vessels traversing the same test section while the propellers were stilled were also conducted.
