Application programming interface The AutoCAD software provides a variety of APIs to access features, functions, objects and data types within the program. AutoCAD's programming interfaces are extensible, which allows third party developers to create plug-ins for AutoCAD that extend its functionalities. AutoCAD scripting Autodesk discontinued support for the AutoCAD script language in version 2019. According to AutoCAD help, the development of the script language "was no longer economical" in 2017. AutoCAD does support some aspects of scripting in newer releases such as "faster execution times for modeling operations and better script-to-code interoperability". Scripting of the old-style.DXF format is available from AutoLISP and AutoGUI scripts. Autocad XML database schema The AutoCAD XML database schema (AcXML) is used to store information about views, blocks, tables

and other objects in a drawing. This includes the value of the objects as well as relationships between them. Although there are no visible differences between different database schemas that are stored in one drawing, the differences between the schemas are used in some operation functions. In the case of importing drawings from different CAD programs, the drawing schema used to save the import data can be chosen to match the current database schema. For saving a drawing using the database schema, the application can be instructed to use the specified database schema. The database schema is flexible enough to store different types of information about an object. This includes: Attributes of the object, relationships between the objects, names of the object and the properties of the object. A database schema usually contains one or more tables (or two or more tables with different sets of objects). A table can be used to store an object with a description of the properties and their value. Other tables may be used to store relational information between the objects. In a typical scenario, a table contains many records, one for each object. Each record contains a unique row number, a position identifier, and one or more rows describing the properties of the object. A typical AutoCAD database schema has only one table for every type of object, including views, blocks, tables and other objects. There are two variations to the database schema that are used: The default schema, and the extension schema. Extension schema The extension schema allows a "plug-in" developer to add his own
