(2011) 32bit-rampatch-v1.0-windows-7-32-bit-with-full-4-gb-or-8-gb-ram-support

note: depending on the ram size, the 32bit-rampatch version will function as described below. if the ram size is less than 4gb, the ram size will not be able to be patched because windows 7 32 bit os has a hard-coded memory limit of 2gb. the 64bit-rampatch version will not be able to patch a ram size greater than 4gb. even if the ram size is patchable, a larger 8gb or 16gb ram configuration will not work because windows software (eg. microsoft office/internet explorer) will run out of memory on windows 64 bit.

1. "memory swap patching"- this access mode patches the ram, disk swap space, and shared memory in same process. the 32bit-rampatch v1.0 supports patching up to 8gb of ram, 1gb of disk swap space, and 512mb of shared memory. if you want to patch more, you will need to configure more ram size, disk swap space, or shared memory.
2. "memory real patching"- this mode patches the ram in multiple processes. it patches memory in multiple processes in sequential order. the ram memory size to be patched in the first process will determine the ram size that can be patched in all the other processes. for example, in order to patch up to 4gb of ram in one process, the total ram size that can be patched in all the other processes must be less than 4gb. because of this, you cannot patch larger than 4gb of ram in one process.
3. "memory image patching"- this mode patches ram from an image file. this mode allows for dynamically resizing and expanding ram in multiple processes. this is only available for linux kernel 2.6.32 and higher. if you want to patch more, you will need to configure more ram size. 5ec8ef588b
