KEYMACRO is an utility to record and edit keystrokes on Windows 7. It can record your keystrokes into two-dimensional arrays and let you make a sequence of recorded keystrokes play back to the current active application. KEYMACRO works with nearly all mainstream keyboards, and its list of supported keymaps includes a full collection of Windows 7 keystrokes. Keyboard layouts are stored in a separate database and can be edited by using its own UI. After installation, KEYMACRO is a separate desktop application that you must launch to record your keystrokes. This application does not come with a wizard to customize its behavior. Using the application After you have run it and installed the database, you can create your first database record by choosing your desired keymap in the first screen and the name of the record in the second one. You can then choose to record a keystroke sequence for the record, which will then be played back at the next keyboard press. Record and play back a keystroke sequence As you can see, when creating a new record, the application asks you to choose between keystroke sequence and text record options. The first one is very easy to use, while the latter one can be a bit more complicated. To use the text record mode, click on the "Text record" button. The record name and record label, as well as the record template, are displayed in the first screen. Selecting the record template is the first step to create a text record. This template can be customized using the provided drop-down list and its content can be edited or removed using the up and down buttons. The record label and the record template options are displayed in the second screen. To edit the label, click on the drop-down list and then select the option you want. The record label is displayed in the first screen, while the record template is displayed in the second one. The record label is automatically displayed to the right of the input field.
